

- Student for M.Sc. in Computer Science, Open University, and B.Sc. degree in Software Engineering, looking for my next challenge in the high-tech industry.
- Hands-on experience & highly skilled with: , and strong foundations in .
- Self-learning, teamwork, time management, strong problem-solving ability, and high communication skills.

: Advanced Topics in Algorithms, Deep learning, Digital Image Processing.

: Software Security, Database Management Systems, Software Engineering Analysis & Design, Object-Oriented Programming – Java, Data Structures & Algorithms, Human-Computer Interaction, Data Science.

- Built a full-featured **Barber Appointment System** that enables customers to book appointments, choose barbers, and receive real-time notifications. I designed the system's architecture and implemented both the frontend and backend using **React, Node.js, and MongoDB**. The backend incorporated **JWT authentication and bcrypt for password hashing** to prevent booking conflicts and optimize barber availability. The app also features **real-time notifications, a barber profile management system, and an admin dashboard** for barbers, providing a smooth and responsive user experience. This project reflects my ability to design scalable systems, apply algorithmic logic in product development, and deliver end-to-end software solutions.
- Developed an automated 3D printing system for the construction industry, capable of interpreting and printing architectural designs. The system integrates with AutoCAD, allowing users to upload design files that are then analyzed and converted into detailed construction instructions for a concrete printer. I **led the development of the software solution, focusing on integrating AutoCAD files with the 3D printer**. I designed the backend **using Python and Django**, implemented the **conversion logic to convert designs into printable instructions**, and integrated the Marlin firmware with RAMPS 1.4 to control the 3D printing hardware.
 - Concrete 3D printing hardware and automation scripting
- Developing backend functionalities using Visual Studio with C#, ASP.NET, and microservices technologies.
- Provided infrastructure services for various websites, including the Turkish Airlines website, ensuring seamless system operations and IT hardware and server maintenance (e.g., hosting services, firewalls, data backup, software updates, and visuals storage).
- Collaborated with cross-functional teams, gaining hands-on experience in loyalty software development and project implementation.
